The breaking load is approximately a quadratic function of the diameter, and may be closely expressed by the formula: $L = cd(d + i)$, where L is the breaking load in pounds, d the diameter of the rope in inches, and c is a constant that is equal approximately to 6300 for the strongest ropes tested, 5000 for the average, and 3700 for the weakest ropes. In other words, with the observed loads from the individual tests plotted for the various diameters of ropes as 1 e 3 4 Piomtttr-inchs Fig. 3.--Relation between breaking load and diameter of manila rope The plotted points show the close agreement of the experimental values with those computed from the formulas shown in Fig. 3, the curve for the average results conforms very closely to the equation (see curve A, Fig. 3): $L = 5000 d (d + i)$. The minimum results are very closely expressed by the equation (see curve C, Fig. 3): $L = 3700 d (d + i)$; and the maximum values are expressed by the equation (see curve B, Fig. 3): $L = 6300 d (d + i)$. These equations apply only to 3-strand, tegular lay manila rope over inch in diameter.: --n h. ii: .in odr -. It should be noted (see Table...
